

Companion scripts for the slide presentation entitled:

**Using the PostgreSQL recursive CTE  
to compute Bacon numbers  
for actors listed in the IMDb**

These *.sql* files were all created simply by copying-and-pasting the relevant code blocks from pages in section “[The WITH clause and common table expressions](#)” in the YugabyteDB documentation.

They are referenced by name in the slides themselves. The comments within the files, the slides, and the YugabyteDB documentation are sufficient to let you understand and run the scripts.

Notice *bacon-employee-sql-features.pdf*. This presents a list of the more notable SQL and PL/pgSQL features that the various scripts use.
